

TraceNet™ Sync

CONTROLLER CONFIGURATION TOOL

QUICK START GUIDE

TraceNet™ Sync QUICK START GUIDE

Tool Bar

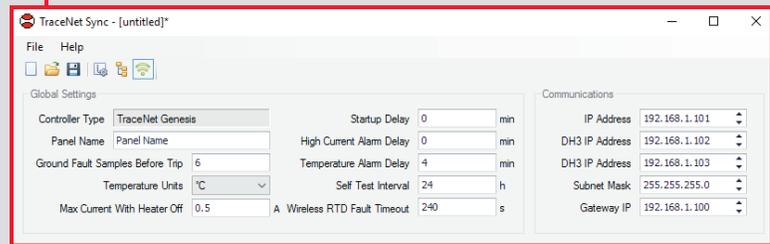

Save: Saves changes to the configuration file open for editing. If the file has not been saved before, the user will be prompted for a filename and location.

Open: Presents a standard "Open File" dialog box, allowing for the selection of an existing Thermon Configuration file (*.thrcfg) file to be opened for editing.

New: Opens a new configuration file with default values.

Networking View: Presents the panel used for configuring the network communications for the control panel.

Designer View: Presents a grid allowing the assignment of settings and drawings to each circuit in the controller. If the file was created in CompuTrace, fields determined from design calculations will be populated from the results for each circuit design. All other fields will be populated with default values.

Assign RTDs To Circuit

Select sensors to assign to the circuit. Each sensor is represented by its type, CAN address and CAN sub address.

RTD: 21-1 RTD: 21-2 RTD: 21-3 RTD: 21-4 RTD: 21-5 RTD: 21-6

OK Cancel

ISOs Count	Design Reference	Process Tag	Trip On High Temperature	Trip On High Current	Trip On High Ground Current	Sensing Type	Relay Type	Control Type	Power At RTD Fault (%)	Power Clamp (%)	Nominal Voltage (V)	Control RTDs
1						Line Sensing	Solid State	On/Off	0.0	100.0	120	
4	ET-112		No	Yes	Yes	Line Sensing	Solid State	On/Off	0.0	100.0	120	
5	ET-133		No	Yes	Yes	Line Sensing	Solid State	On/Off	0.0	100.0	120	
6			No	Yes	Yes	Line Sensing	Solid State	On/Off	0.0	100.0	120	

Right-click on the value in the *ISOs Count* column and select *Add* to access a navigation window and assign an ISO image to that circuit.

Right-click on the value in the *Control RTDs* column and select *Assign RTDs To Circuit* to see and assign available RTDs to that circuit.

Hardware View: Presents the screen containing 3 tabs for assigning CAN Addresses associated with Devices, Circuits and Sensors.

DTMs address blocks of 6 in the same way the DCM addresses 6 circuits. For this reason, clicking the *Add Sensor* button on the *Sensor* tab with RTD selected will add 6 RTDs. Note: clicking the *Add Sensor* button with the wireless RTD (OWRTD) selected will add only one sensor at a time. Adding a wireless RTD on the *Sensor* tab will automatically add a DH3 on the *Devices* tab. Each DH3 can address up to 63 Wireless RTDs.

The CAN addresses are subdivided per device, and are allocated per the ranges indicated in the table to the right.

CAN Addresses	
DCM's	01 : 20
DTM's	21 : 80
IOM's	81 : 99
DH3's	101 : 102

The screenshot shows the TraceNet Sync interface. The **Device** tab lists:

Device Type	CAN Address
1 DCM	01
2 DTM	21

The **Circuit** tab lists:

Circuit Name	CAN Address	CAN Sub Address
1 0001	01	1
2 0002	01	2
3 0003	01	3
4 0004	01	4
5 0005	01	5
6 0006	01	6

The **Sensor** tab lists:

Sensor Type	CAN Address	CAN Sub Address	Ambient
1 RTD	21	1	No
2 RTD	21	2	No
3 RTD	21	3	No
4 RTD	21	4	No
5 RTD	21	5	No
6 RTD	21	6	No

To Import And Multiple ISO Images And Assign To Circuits

From any view (Designer, Networking, or Hardware) select *File* and *Import Images*. The *Import Images* window will open.

Select *Add ISO* to open a navigation window, allowing the selection of multiple ISO image files.

- or -

Select *Auto Assign* to automatically assign drawings to designs if they have the same name.

ISOName	Design Reference	Process Tag	ISO Name
ET-101-01.pdf	1 ET-101		
ET-101-02.pdf	2 ET-107		
ET-107-01.pdf	3 ET-108		
ET-108-01.pdf	4 ET-112		
ET-112-01.pdf	5 ET-133		
ET-133-01.pdf	6 ET-146		
ET-146-01.pdf			

Buttons: Add ISO, Auto Assign, Apply, Cancel

Drag and drop ISO image files to the appropriate circuit.

Select *Apply* to save the ISO assignments.

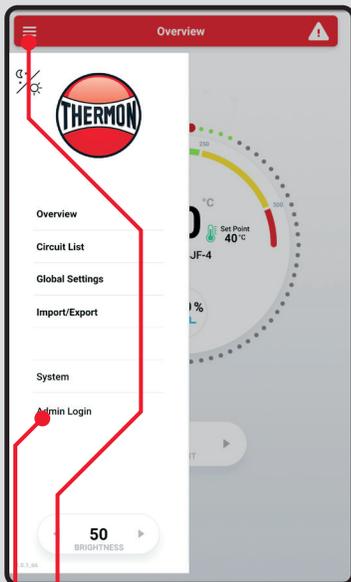

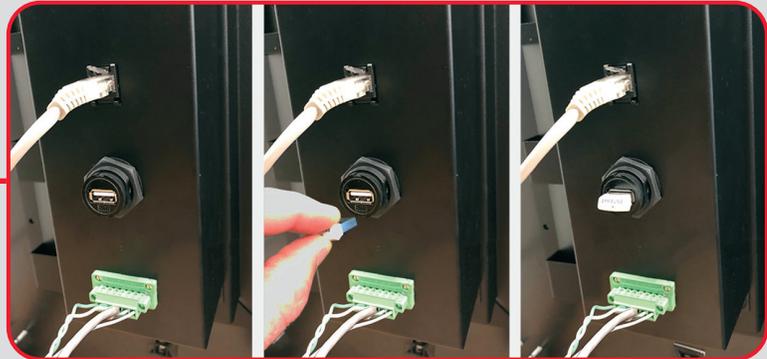

ISOName	Design Reference	Process Tag	ISO Name
ET-101-01.pdf	1 ET-101		ET-101-01
ET-101-02.pdf	2 ET-107		ET-101-02
ET-107-01.pdf	3 ET-108		ET-107-01
ET-108-01.pdf	4 ET-112		ET-108-01
ET-112-01.pdf	5 ET-133		ET-112-01
ET-133-01.pdf	6 ET-146		ET-133-01
ET-146-01.pdf			ET-146-01

Buttons: Add ISO, Auto Assign, Apply, Cancel

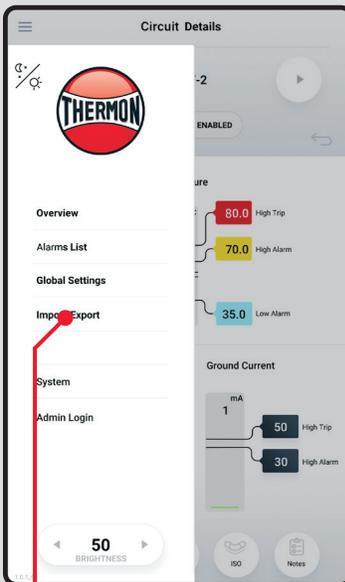

To Import the *.thrcfg File Into Genesis Panels

Copy the *.thrcfg to a suitable USB drive. The drive should be USB 3.0 or higher and formatted as "FAT32" with a single MBR partition. The file must be located in the root directory of the USB drive.

Insert the drive into the back of the controller.

Navigate to the Circuit View screen and tap on the three bars in the upper left corner ("Hamburger Menu"). Select *Admin Login* or *System* to bring up the login prompt. Log in to the controller as Administrator.

Using the "Hamburger Menu" select *Import/Export*.

Select the *.thrcfg file you wish to import.
