

# TraceNet™ Sync

## CONTROLLER CONFIGURATION TOOL

TraceNet Sync simplifies the configuration of Thermon's TraceNet electronic control and monitoring solutions. This software application enables rapid system configuration by replacing manual entry of settings and configuration data with a Thermon configuration (\*.thrcfg) file. This new software tool electronically pulls design information and isometric drawings from our CompuTrace and VisiTrace 3D design environments, allows the input of additional settings, and packages all the information into a configuration file. This file then transfers all information to our controllers electronically.

Utilizing TraceNet Sync and the .thrcfg file dramatically reduces time, and provides higher data integrity by eliminating manual data entry. This tool enables users to extract and backup settings, simplifying the task of maintaining and servicing controllers. TraceNet Sync allows users to define the panel configuration remotely, reducing or eliminating costly field time required at the panel.

### New Release Features:

- Assurance that panels are configured as designed
- Minimizes labor during panel setup and commissioning
- Digital exchange eliminates data entry or data omission errors

TraceNet Sync is compatible with TraceNet Genesis version 1.2.0 and later.
